PRODUCTION OEE

Production Overall Equipment Effectiveness

Production OEE is an advanced integrated Asset Optimization module, designed specifically to **Maximize Production**. This is achieved through the identification and capture of additional capacity and capability in either single or groups of assets or complete production-based units.

Designed and built by MPPI Global, Production OEE uses the “Theory of Constraints”, blended with traditional OEE measures, and the Assets Production Equation to target production improvement opportunities.

This Optimum Module uses capacity to identify performance capability and establish measures across the production equation for simple, concise improvement opportunities, called the “Opportunity Gap”.

As Production OEE balances with your production equation, improvement opportunities and projects become simple to identify, with clear ROI on each activity. Production OEE uncomplicates and provides clear transparency about where your operation or asset is performing today, and what needs to be done to increase production.

Production OEE is a dedicated module ideal at increasing production, revenue and overall profit for your operations.

PRODUCTION OEE FEATURES

Based upon the Theory of Constraints

Identifies availability, performance, and quality losses across any asset

Clarifies production opportunities

Drives year-on-year improvement

Identifies the Opportunity Gap against an asset's true capability

Increased production and revenue
